

Reminder / Recall & Forecasting Modules

Advancing Public Health Outcomes Through Information Technology

The STC Forecasting and Reminder/Recall modules are two tools that work together to enhance the functionality of an immunization registry.

The Forecasting application is a tool used to alert providers of any patient vaccinations that are due. ACIP guidelines are used to validate and forecast patient vaccinations. The Forecasting tool integrates seamlessly and easily with existing immunization registries.

The Reminder/Recall application provides a web-based interface to query and view patients that are due for immunizations. The Reminder/Recall tool can then be used to generate various types of reminders such as postcards, mailing labels, and auto dialer files. The interface, which can also be integrated into existing immunization registries, generates reminder/recall lists by date of birth, based on the existing immunization records. STC offers a product suite of over forty registry-based tools that allow clients to choose the products which will best serve their individual needs

The STC product line is recognized as the foremost immunization registry system in the U.S. market today and includes proven immunization functionality that can be used to increase immunization coverage levels, reduce pockets of need, and maximize limited program resources. The products have been used at the state level, as well as in public health clinics, private physician offices, community health clinics, WIC offices, and mobile and outreach clinics.
