

Third-party Billing Module for Immunization Programs

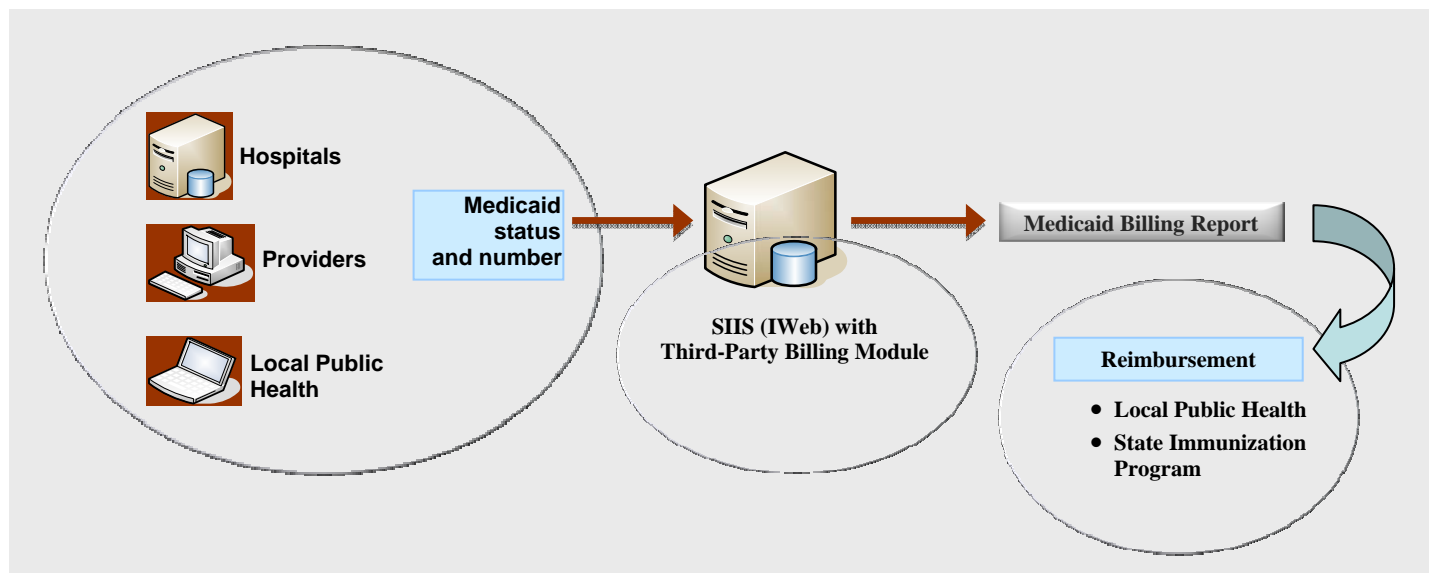

Advancing Public Health Outcomes Through Information Technology

Among the many challenges facing public health immunization programs, one remains constant: the goal of increasing population-based immunization rates in the face of diminishing program budgets. STC's *Third-Party Billing Module* offers the opportunity to increase vaccine uptake and generate increased revenue for program operations.

Statewide immunization programs benefit from a self-sustaining process, recovering a portion of reimbursements to sustain program operations. Local public health systems benefit from maximizing their recovery of immunization administration fees in exchange for contributing administered immunization data to the registry.

STC can assist interested state immunization programs in establishing feasible reimbursement structures and arrangements, identifying additional third-party payers beyond Medicaid, and leveraging module functionality across multiple participants.

STC would be pleased to discuss specifics of your program needs in this regard. Assessments and strategic planning services are also available to support your interests in advancing other cost-recovery solutions.
